

HOMEBIOGASTM BIO-TOILET

MANUAL, LOW-FLUSH, ECO TOILET

MORE INFO

The Bio Toilet connects to the existing HomeBiogas 2.0 appliance to create cooking gas and fertilizer from human waste.

The Bio Toilet is a low flush toilet (uses only 1.2 liters of water per flush), that does not require running water and can utilize grey water.

It is perfect for those wishing to live off-the-grid and is a solution for underseverd communities that do not have access to latrines.

Just like the HomeBiogas appliance, the toilet will be shipped in a small box. The piping and connectors needed will come in a separate a box. The kit will arrive with a simple do-it-yourself assembly so that you can connect it to your HomeBiogas 2.0 with ease.
